CONCRETE GLOWING GARDEN LIGHTS

Step-by-Step DIY Guide

Complete with Materials List & Pro Tips

Transform your garden path into a magical glowing walkway

made-by-hand.com

About This Project

These beautiful concrete garden lights look like natural glowing stones — perfect for lighting up garden paths, borders, or flower beds. Each light houses a small rechargeable LED puck inside a handcrafted concrete shell, so it glows softly from within at night. The project takes under 30 minutes of active work, plus curing time. No special skills required!

Difficulty	Easy
Active time	20–30 minutes
Curing time	24 hours minimum
Cost per light	$3–8 USD (depending on LED puck)
Skill level	Beginner friendly

Materials & Tools

#	Item	Notes
1	Rapid-set concrete mix	Fine-grain or craft concrete works best. Avoid coarse mixes.
2	Round silicone mold	Approx. 15–18 cm diameter, 6–8 cm deep. Flexible for easy demolding.
3	LED puck light (solar or battery)	Small push-light or solar puck that fits in center of mold.
4	Water	Clean tap water — roughly 1 part water to 2.5 parts concrete powder.
5	Mixing container + stirrer	A plastic bucket or measuring cup. Wooden stick or old spoon.
6	Nitrile gloves	Protect your hands from concrete alkalinity.
7	Cooking spray / mold release	Optional — helps demold cleanly. Petroleum jelly also works.
8	Sandpaper (120–220 grit)	Optional — for smoothing rough edges after curing.
9	Concrete sealer (outdoor)	Optional but recommended for weather resistance.

■ ***Tip:*** *You can find round silicone molds at craft stores or online. Push-light LED pucks are available at dollar stores or Amazon for under $3 each.*

Step-by-Step Instructions

Step 1 — Place the LED Light in the Mold

LED puck positioned face-up in the center of the silicone mold

Place your silicone mold on a flat, stable surface — a workbench or table outdoors works perfectly. Lightly spray the inside of the mold with cooking spray or rub with petroleum jelly to help with demolding later.

- Turn the LED puck ON before placing it in the mold — this way you can see if it's working once covered.
- Center the LED puck face-up at the bottom of the mold, with the light facing upward.
- Press it down firmly so it won't float when the concrete is poured.

> ■ ***Tip:*** *Use a battery-powered push light or a solar puck. If using solar, make sure the solar panel faces upward so it recharges through the concrete.*

Step 2 — Mix the Concrete

In your mixing container, combine the concrete powder and water. A good starting ratio is **2.5 parts concrete to 1 part water** (by volume). Mix thoroughly until you get a smooth, lump-free consistency — similar to thick pancake batter.

- Add water gradually — it's easier to add more water than to fix a mix that's too runny.
- Mix for at least 2–3 minutes, scraping the sides of the container.
- The mix should flow slowly when tilted, not splash.

■ ***Safety:*** *Always wear nitrile gloves when handling wet concrete. Wet concrete is alkaline and can irritate or burn skin with prolonged contact.*

Step 3 — Pour the Concrete over the Light

Carefully pouring concrete mix over the LED puck in the mold

Mold filled to the brim — concrete covers the LED puck completely

Slowly pour the concrete mix into the mold, pouring directly over the center where the LED puck sits. Pour steadily and evenly until the concrete reaches the top edge of the mold.

- Pour slowly to avoid trapping large air bubbles around the light.
- Tap the sides of the mold gently with your hand to release any trapped air — this improves the surface finish.
- Fill all the way to the top for a solid, heavy stone feel.
- Smooth the surface with a flat tool or your gloved finger.

■ ***Tip:*** *If you see small bubbles rising to the surface, that's normal. Keep tapping the mold for 30–60 seconds after pouring.*

Step 4 — Let It Cure (24 Hours)

Leave the filled mold undisturbed in a cool, shaded location to cure. Rapid-set concrete takes **24 hours** for a basic cure — during which time do not move or touch the mold.

- Keep the mold out of direct sunlight during curing to prevent cracking.
- Cover loosely with a plastic bag or cloth to slow the drying and reduce surface cracking.
- Concrete continues to strengthen for up to 28 days — it's safe to use after 24h but gets stronger with time.

■ ***Tip:*** *In hot weather, lightly mist the surface with water after 4–6 hours to prevent surface cracking.*

Step 5 — Demold Your Garden Light

Gently peeling back the silicone mold to reveal the hardened concrete stone

After 24 hours, your concrete should feel completely solid. Gently peel back the silicone mold — it should flex away cleanly, leaving a smooth-textured concrete stone with the LED light embedded in the center.

- Start peeling from one edge, working your way around.
- If it resists, wait another few hours and try again.
- The bottom (where the LED is) should pop out cleanly.

> ■ ***Tip:*** *If the surface has rough spots or sharp edges, sand lightly with 120-grit sandpaper for a more polished natural-stone look.*

Step 6 — Place in Your Garden

Finished concrete garden light placed on lawn — LED glowing in center

Your concrete garden light is ready! Place it along a path, in a flower bed, or near the edge of your lawn. Press it slightly into the soil so it sits flat and stable.

- Group several together for a dramatic glowing path effect.
- Mix different sizes by using different mold diameters.
- For a more natural look, press slightly into soil so it appears to emerge from the ground.

> ■ ***Optional:*** *Apply a coat of outdoor concrete sealer for better weather resistance and a longer-lasting finish. Use a matte sealer to keep the natural stone look.*

The Result

Multiple concrete garden lights creating a magical glowing pathway at night

Pro Tips & Variations

★ **Use rapid-set concrete**	Regular concrete mix requires 24-48h to cure; rapid-set mixes can cure in 4–6 hours, letting you demold the same day.
★ **Try different mold shapes**	Oval, hexagonal, or elongated molds create a more natural 'scattered stone' look. Food-grade silicone baking molds work perfectly.
★ **Color the concrete**	Add concrete pigment powder to the mix before pouring — terracotta, charcoal, or slate blue all look stunning in a garden setting.
★ **Use solar-powered pucks**	Solar LED pucks charge during the day through the concrete (which is slightly translucent when thin) and glow automatically at night — no wiring needed.
★ **Waterproof the LED compartment**	Apply a thin ring of silicone sealant around the edge of the LED puck before embedding to prevent moisture intrusion.
★ **Make a mold yourself**	You can create a mold using a round plastic container (yogurt tub, deli container). Cut it after curing to remove.
★ **Add aggregate for texture**	Mixing in small pebbles or coarse sand creates a rougher, more natural stone texture on the surface.
★ **Group in odd numbers**	Design rule: groups of 3, 5, or 7 lights always look more natural and aesthetically pleasing than even-numbered arrangements.

Troubleshooting

✗ Problem: Concrete cracked during curing

✓ **Solution:** Too much water in the mix, or it dried too fast. Next time use less water and cover the mold during curing. Small surface cracks are cosmetic only and don't affect function.

✗ Problem: Won't demold — stuck to mold

✓ **Solution:** Wait another 6–12 hours. If still stuck, flex the mold firmly — silicone should release. In future, use more mold release spray before pouring.

✗ Problem: LED is dim or not working

✓ **Solution:** The concrete shell may be too thick, blocking solar charging. Try a thinner top layer or switch to a battery-powered LED puck.

✗ Problem: Rough or pitted surface

✓ **Solution:** Air bubbles in the mix. Tap the mold more vigorously right after pouring. Also try mixing slightly more slowly to reduce aeration.

✗ Problem: Light floated to the side

✓ **Solution:** The LED wasn't pressed down firmly enough. Next time hold it in place for 2–3 minutes while the concrete starts to set around it.

Thank you for your purchase!

We hope you enjoy making your own glowing garden lights. Share your results with us — we'd love to see your garden!
